Calculation of the Two-Way Analysis of Variance (ANOVA) Using a Programmable Pocket Calculator

By: Paul D. Evenson
Assoc. Professor
Plant Science and Statistics

The two-way ANOVA is one of the most used experimental designs in statistics. A program is described in this paper which requires the input of each piece of data only once.

The calculator computes the means of all rows and columns, the complete ANOVA including F-tests, the components of variance, and the coefficient of variation. An unlimited number of rows and up to ten columns can be handled by this program, which was written for the Hewlett Packard 97 programmable "pocket" calculator.

The two-way ANOVA tests the homogeneity of row means and column means. If there are significant differences among row

means, we will reject the null hypothesis that means of populations (μ_i 's) of row factors are equal ($H_0 : \mu_1 = \mu_2 = \dots = \mu_r$), and accept the alternative hypothesis that means of populations of row factors are unequal ($H_1 : \mu_1 \neq \mu_2 \neq \dots \neq \mu_r$). In the same manner, if there are significant differences among column means, we reject $H_0 : \mu_1 = \mu_2 = \dots = \mu_c$ and accept $H_1 : \mu_1 \neq \mu_2 \neq \dots \neq \mu_c$.

The X_{ij} denotes the variable in the i^{th} row and the j^{th} column, where $i = 1, 2, 3, \dots, r$ and $j = 1, 2, 3, \dots, c$. A dot (.) in place of a subscript means that the variables have been summed across the subscript, e.g., $\sum_i X_{ij} = X_{.j}$

Formulas for Calculation of Row and Column Means

1. row means = $\bar{x}_{i.} = \frac{X_{i.}}{c}$

2. column means = $\bar{x}_{.j} = \frac{X_{.j}}{r}$

Formulas for Calculation of Two-Way ANOVA

1. correction term = $C = \frac{X_{..}^2}{rc}$
2. total sum of squares = $SS_T = \sum X_{ij}^2 - C$
3. row sum of squares = $SS_R = \frac{\sum X_{i.}^2}{c} - C$
4. column sum of squares = $SS_C = \frac{\sum X_{.j}^2}{r} - C$
5. error sum of squares = $SS_E = SS_T - SS_R - SS_C$

Note: d.f. = degrees of freedom

$$\text{M.S.} = \text{mean square} = \frac{SS}{df}$$

M.S.E. = mean square expectations

σ^2 = variance of population

s^2 = variance of a sample

Source	df	SS	ANOVA	MS	F	MSE
Total	$rc-1$	SS_T		--	--	--
Row	$r-1$	SS_R		$\frac{SS_R}{r-1} = MS_R$	$\frac{MS_R}{MS_E}$	$\sigma^2 + c\sigma_R^2$
Column	$c-1$	SS_C		$\frac{SS_C}{c-1} = MS_C$	$\frac{MS_C}{MS_E}$	$\sigma^2 + r\sigma_C^2$
Error	$(r-1)(c-1)$	SS_E		$\frac{SS_E}{(r-1)(c-1)} = MS_E$		σ^2

Formulas for Calculation of Variance Components

$$\sigma^2 = MS_E$$

$$\sigma_C^2 = \frac{MS_C - MS_E}{r}$$

$$\sigma_R^2 = \frac{MS_R - MS_E}{c}$$

Formula for Calculation of Coefficient of Variation (C.V.)

$$\text{C.V.} = \frac{\sqrt{MS_E}}{\bar{x}_{..}} \times 100$$

$$\text{where } \bar{x}_{..} = \frac{X_{..}}{rc}$$

User Instructions

Two-way ANOVA
