Chemical Weed Control in Soybeans: 1984

Leon J. Wrage, Extension agronomist, weeds
W. E. Arnold, Professor, plant science

Losses from weeds in soybeans can be serious. Annual broadleaves such as sunflowers, velvetleaf, or cocklebur are difficult to control. Most perennial weeds cannot be controlled. Herbicides are an aid to a good rotation, proper seedbed preparation, and cultivation.

Herbicide Suggestions

Information in this publication is based on South Dakota Agricultural Experiment Station research and other research or observations. Herbicides are included only after the chemical is registered by the Environmental Protection Agency (EPA) as to residue tolerances in crops used for food or feed.

The information does not imply a guarantee or responsibility for results. The use of tradenames is for reader convenience and does not imply product endorsement. The label should be considered the final guide. Users are responsible for following all label directions and precautions.

Weed Problems. Weeds are grouped as small-seeded annual broadleaves (kochia, lambsquarters, pigweed, etc.), annual grasses (green or yellow foxtail, etc.), or perennial weeds. Control is rated poor, fair, good, very good, or excellent for each category of weeds.

Special Weed Problems. A section for "Special Weed Problems" gives the best treatments for each weed.

Herbicides. Most herbicides are listed by tradename. The common name is also included in the heading in parentheses. Only the common name is used when the same active ingredient is available in several products.

Treatments listed under "Soybean Herbicides" are those considered to be promising for most situations in South Dakota. Those listed under "Other Soybean Herbicides" may be useful for special problems, are inadequately tested, or have given less consistent performance.

Rate. Rates for each treatment are stated as the amount of product per acre. All rates are on a broadcast basis; adjust accordingly for band application.

Time to Apply. Herbicides may be applied: PREPLANT INCORPORATED: before the crop is planted, incorporated as directed. SHALLOW PREPLANT INCORPORATED: preplant incorporated, but herbicide is usually restricted to the top 2 to 3 inches of soil with single-pass incorporation.

PREEMERGENCE: after planting, but before crop or weeds emerge.

POSTEMERGENCE: after the crop or weeds have emerged.

Band vs. Broadcast

One cultivation is usually needed with broadcast applications. Banding reduces the cost per acre and usually replaces one or two row cultivations.

Adjust broadcast rates for banding. A 12- to 14-inch band is suggested for top planting; a 7-inch band is suggested for most deep furrow or lister-planted crops.

Drilled Or Solid Seeding

Drill-planted or solid-seeded soybeans are more competitive with weeds after the first 3 to 4 weeks.

Early season control is critical. Preplant or preemergence combinations are strongly suggested where both annual grasses and broadleaves are present.

Do not use these planting systems if perennials are a problem. Use the maximum herbicide rate for the soil type.

Reduced Tillage Systems

Furrow And Top-plant

Crop residue on the surface may distort the spray pattern or intercept some of the herbicide. Using the maximum rate for the soil type will partially compensate; however, the amount used should not exceed labeled rates. Heavy residue should be worked into the soil before broadcasting soil-applied treatments. Devices to move residue from the row area will improve results for band application.

Do not use preplant incorporated treatments with deep furrow or lister planting. A treated soil is moved from the row area. For these systems, limit band width of preemergence herbicides to the width of the furrow bottom. Check herbicide label for restrictions on furrow planted crops.

FOLLOW THE LABEL

Federal regulations make it unlawful for any person to use an herbicide in a manner inconsistent with its labeling. This includes the kind of crop and weed; rate, carrier, and other application directions; storage, disposal, and protective clothing; or other precautions stated.

Herbicides

The herbicide products discussed in this publication are listed below.

Abbreviations Used

pt = pint
qt = quart
gal = gallon
lb = pound
lb/gal = pound per gallon active or acid equivalent
W = wettable powder
DF = dry flowable (spray)
L = liquid flowable
(G) gran = granule
and/or tank-mix (+)
act = actual, active, or acid equivalent
SOYBEAN HERBICIDES

Treflan (TRIFLURALIN)

1-2 pt Treflan or 10-20 lb Treflan 5G (½-1 lb act)

Excellent control of most annual grasses and fair control of small-seeded annual broadleaves such as pigweed and lambsquarters. Does not control mustard, nightshade, smartweed, or large-seeded annual broadleaves. Consistent performance. Very good crop tolerance. Low rate is for light, low organic matter soil; the high rate is for heavy, clay soil. Rate of 1 ½ pt/A has been satisfactory in most SDSU tests. Liquid formulation may be applied in liquid fertilizer or may be impregnated onto certain dry fertilizers. Minimum carrier is 5 gpa for ground or air. Carryover may damage oats or sorghum planted the following year.

Liquid or granule formulation may be applied in late fall and incorporated with one fall tillage operation and one pass in the spring. Spring application seems best suited for most soybean situations. Liquids usually preferred for spring application. Granules appear to fit best for fall applications. Limited data or experience with fall applications in soybeans; however, weed control with fall applied granules has been equal to that for spring applied liquid.

PREPLANT INCORPORATED. Immediate preferred, but may be delayed up to 24 hours if soil surface is dry and wind is under 10 mph. Incorporate into the top 2 to 3 inches of soil using a tandem disk with small blades set to cut 4 to 6 inches deep operated at 4 to 6 mph, a field cultivator equipped with three or four rows of sweeps spaced no more than 7 inches apart, or other suitable equipment. A second incorporation improves uniformity, especially under wet, lumpy, or trashy conditions. Follow with a harrow or leveling device. A tandem disk followed by a field cultivator provides good incorporation under a variety of conditions. Improper incorporation reduces control.

Prowl (PENDIMETHALIN)

1-3 pt Prowl (½-1½ lb act)

Excellent control of most annual grasses and fair control of small-seeded annual broadleaves such as pigweed and lambs-quarters. Does not control mustard, nightshade, smartweed, or large-seeded annual broadleaves. Consistent performance as a preplant incorporated treatment. Very good crop tolerance if properly incorporated; less tolerance if left on the surface. Lower rates are for light, low organic matter soil; the higher rates are for heavy, clay soil. Rate of 2½ pt/A has been satisfactory in most SDSU tests. Preplant incorporated applications may be made in liquid fertilizer or impregnated onto certain dry fertilizers. Minimum carrier is 10 gpa for ground or 5 gpa for air. No label restrictions for crops planted the following year. Problems have not been observed under normal conditions.

PREPLANT INCORPORATED. Immediate incorporation preferred, but may be delayed up to 7 days. Incorporate with a small-bladed tandem disk set to cut 2 to 4 inches deep, field cultivator, or other suitable equipment. A second incorporation improves uniformity, especially if no rain was received or under lumpy, trashy conditions. One pass, shallow incorporation may be adequate if the soil has been prepared adequately prior to application. Follow with a harrow or leveling device. Improper incorporation reduces control.

Basalin (FLUCHLORALIN)

1-3 pt Basalin (½-1½ lb act)

Excellent control of most annual grasses and fair control of small-seeded annual broadleaves such as pigweed and lambsquarters. Does not control mustard, nightshade, smartweed, or large-seeded annual broadleaves. Consistent performance. Very good crop tolerance. Low rate is for light, low organic matter soil; the high rate is for heavy, clay soil. Rate of 2 pt/A has been satisfactory in most SDSU tests. Minimum carrier is 10 gpa for ground application. No label restrictions for crops planted the following year. Problems have not been observed under normal conditions.

PREPLANT INCORPORATED. Immediate incorporation preferred, but may be delayed up to 8 hours if soil surface is dry. Incorporate into the top 1 to 2 inches of soil with a small-bladed tandem disk set to cut 2 to 4 inches deep, a field cultivator, or other suitable equipment. A second incorporation improves uniformity, especially under wet, lumpy, or trashy conditions. A tandem disk followed by a field cultivator gives good incorporation under a range of conditions. Follow with a harrow or leveling device. Improper incorporation reduces control.
**Vernam (VERNOLATE)**

2½-3½ pt Vernam 7E (2-3 lb act)

Good control of several annual grasses and some small-seeded annual broadleaves such as pigweed or lambsquarters. Does not control mustard, nightshade, or large-seeded annual broadleaves. Some suppression of velvetleaf. Good crop tolerance; crop outgrows initial emergence delay and leaf malformation. Low rate is for light, low organic matter soil. Rate of 3 pt/A has been used in most SDSU tests. May be applied in liquid fertilizer or may be impregnated onto certain dry fertilizers. Minimum carrier is 10 gpa. No carryover.

PREPLANT INCORPORATED. Must be incorporated immediately. Incorporate into top 2 to 3 inches of soil with a small-bladed tandem disk set to cut 4 to 6 inches deep followed by a harrow or leveling device. A second incorporation insures uniformity. Improper incorporation reduces control.

---

**Treflan and/or Sencor or Lexone (TRIFLURALIN AND/OR METRIBUZIN)**

**Prowl and/or Sencor or Lexone (PENDIMETHALIN AND/OR METRIBUZIN)**

**Basalin and/or Sencor or Lexone (FLUCHLORALIN AND/OR METRIBUZIN)**

1-2 pt Treflan and/or ½-1 pt Sencor or Lexone 4L or ½-1 lb Sencor or Lexone 50W or ½-7½ lb Sencor or Lexone 75DF (½-1 and/or ¼-½ lb act)

1½-2½ pt Prowl and/or ½-1 pt Sencor or Lexone 4L or ½-1 lb Sencor or Lexone 50W or ½-7½ lb Sencor or Lexone 75DF (¾-1¼ and/or ¼-½ lb act)

1-2 pt Basalin and/or ½-1 pt Sencor or Lexone 4L or ½-1 lb Sencor or Lexone 50W or ½-7½ lb Sencor or Lexone 75DF (½-1 and/or ¼-½ lb act)

Excellent control of several annual grasses and small-seeded annual broadleaves. Fair to good control of some large-seeded annual broadleaves. Of the soil applied treatments, metribuzin gives the best annual broadleafed weed control. Fair crop tolerance. Risk of injury from metribuzin on variable, sandy, high pH, low organic matter soils or on clay knolls. Do not use on soil that is sandy, has a pH over 7.4, or less than 1% organic matter. Cold, wet soil conditions that slow crop emergence increase risk of injury. Combined effects of metribuzin with atrazine carryover can produce serious crop injury. Use lower rates for light, lower organic matter soils. Higher rates are for heavy, clay, low pH soils.

Sencor or Lexone at ½ pt of 4L or ½ lb of 50W or ½ lb of 75DF formulation per acre (¼ lb/A active) usually gives satisfactory control of light infestations of most small-seeded broadleaves and reduces risk of crop injury, especially for inexperienced growers. Use maximum rate for soil type for best control of weeds like sunflower or velvetleaf. Minimum carrier is 10 gpa for tank-mix with ground equipment. Refer to section for Treflan, Prowl, or Basalin for limitations and precautions.

PREPLANT INCORPORATED. Tank-mix. Incorporate as for Treflan or Prowl or Basalin alone. Best performance if rainfall very limited, but may give slightly less control of large-seeded annual broadleaves and have slightly less crop tolerance than split overlay application. Maximum metribuzin rate is 3/8 lb/A active for most soils. Rates of 1½ pt Treflan or 2½ pt Prowl or 2 pt Basalin + Sencor or Lexone at ¾ pt of 4L or ¾ lb of 50W or ½ lb of 75DF formulation per acre have been satisfactory in most SDSU tests. More convenient than split overlay application and good choice for small-seeded broadleaves.

**SPLIT PREPLANT INCORPORATED AND PREEMERGENCE.** Apply usual rate of Treflan or Prowl or Basalin preplant and incorporate as for each herbicide used alone. Apply Sencor or Lexone preemergence after planting. Maximum Sencor or Lexone rate is ¾ to 1 pt of 4L or ¾ to 1 lb of 50W or ½ to ¾ lb of 75DF formulation per acre. Slightly better crop tolerance than for preplant tank-mix but requires a second application.

**SPLIT TANK-MIX PREPLANT INCORPORATED AND PREEMERGENCE.** Incorporate a tank-mix of the usual rate of Treflan or Prowl or Basalin with Sencor or Lexone as for the preplant incorporated treatment. Apply additional Sencor or Lexone preemergence after planting. Rates for the additional Sencor or Lexone for most soil are from ¼ to ¾ pt of 4L or ¼ to ¾ lb of 50W or ½ to ¾ lb of 75DF formulation per acre. Rates of ¼ pt of 4L or ½ lb of 50W or ½ lb of 75DF Sencor or Lexone formulation per acre have been used as the overlay in most SDSU tests. Provides better crop tolerance when higher Sencor or Lexone rates are needed for better control of weeds such as velvetleaf. Promising for special situations. Follow soil precautions carefully.

PREEMERGENCE. Tank-mix. Prowl + Sencor or Lexone only. Rates as for pre-plant tank-mix. Much less consistent grass control than other application methods except with ideal rainfall. Less crop tolerance.
**Treflan and Lorox** (TRIFLURALIN AND LINURON)

**Prowl and/or Lorox** (PENDIMETHALIN AND LINURON)

</tbody>
</table>
**Lasso (Alachlor)**

*2-3 1/2 qt Lasso or 16-26 lb Lasso II (broadcast) (2-3 1/2 lb act)*

Very good to excellent control of several annual grasses and fair control of pigweed with high rates and favorable conditions. Useful for special weed problems such as nightshade or nutsedge. Consistent on annual grasses when rainfall or soil moisture requirements are met. Excellent crop tolerance. Low rate is for light, low organic matter soil; the high rate is for heavy clay soil. Rates of 2 1/2 to 3 qt Lasso or 18 to 20 lb Lasso II per acre (broadcast) have been satisfactory in most preemergence SDSU tests. Preplant spray or preemergence applications may be applied in liquid fertilizer. Preplant spray application may be impregnated onto certain dry fertilizers. Use 2 1/2 to 4 qt/A where soybeans are planted into high amounts of crop residue in minimum tillage systems. Minimum carrier is 10 gpa for ground and 3 gpa for air. Granule or spray formulations appear equally effective. Granules are applied to the soil surface behind the press wheel. Adjust granule rate for banding. No carryover.

**SHALLOW PREPLANT INCORPORATED.** Incorporate into top 2 inches of soil with a field cultivator, shallow disk, multiweeder, or other suitable equipment during final seedbed preparation. Flextine harrow is not satisfactory. Will improve control when rainfall is very limited but gives slightly less control than preemergence application with adequate rainfall. Some rainfall improves results. Proper incorporation may be difficult with trashy, lumpy seedbed. Deeper incorporation reduces annual grass control. Use 1 pt/A more Lasso than for preemergence. Rate of 3 1/2 qt/A Lasso has been used in most tests. Furrow planters will move treated soil from row area.

**PREEMERGENCE.** Requires ½ to ¾ inch rainfall within one week after application. Use a harrow or rotary hoe if weeds emerge before rainfall is received. Travel the same direction as the rows if banded.

**EARLY POSTEMERGENCE.** Primarily for situations where unanticipated delays prevented preplant or preemergence application. Will not control emerged weeds. Apply before soybeans have more than two true leaves. Do not apply in liquid fertilizer.

**Dual (Metolachlor)**

*2-3 pt Dual BE or 8-12 lb Dual 25G (broadcast) (2-3 lb act)*

Very good to excellent control of several annual grasses and fair control of pigweed with high rates and favorable conditions. Useful for special weed problems such as nightshade or nutsedge. Consistent on annual grasses when rainfall or soil moisture requirements are met. Excellent crop tolerance. Low rates are for light, low organic matter soil; the high rate is for heavy clay soil. Rates of 2 1/2 to 3 pt Dual or 10 to 12 lb Dual 25G (broadcast) have been satisfactory in most SDSU tests. Spray may be applied in liquid fertilizer. Preplant incorporated applications may be impregnated onto certain dry fertilizers. Minimum carrier is 10 gpa for ground and 2 gpa for air. Limited data on granule formulation. Adjust granule rate for band. Granules are applied to the soil surface behind the press wheel. No carryover.

**SHALLOW PREPLANT INCORPORATED.** Incorporate into top 2 inches of soil with a field cultivator, shallow disk, or other suitable equipment during final seedbed preparation and within 14 days before planting. Will improve results when rainfall is very limited but gives slightly less control than preemergence application with adequate rainfall. Proper incorporation may be difficult with trashy, lumpy seedbed. Deeper incorporation reduces annual grass control. Use maximum rate for soil type.

**PREEMERGENCE.** Requires ½ to ¾ inch rainfall within one week after application. Use a harrow or rotary hoe if weeds emerge before rainfall is received. Travel the same direction as the rows if banded.

**Amiben (Chloramben)**

*1-1 1/2 gal Amiben or 2.4-3.6 lb Amiben 75DS or 20-30 lb Amiben 10G (broadcast) (1.8-2.7 lb act)*

Good control of several annual grasses and good to very good control of some small-seeded annual broadleaves such as pigweed, lambquarters, or smartweed. Very good Russian thistle control in some tests. Variable control of velvetleaf. Does not control sunflower. Some erratic results. Rainfall critical. Good crop tolerance. Some stunting noted with heavy rainfall at emergence. Spray or granule forms appear equally effective. Granules are applied to soil surface behind the press wheel. Low rate for light, low organic matter soil. Amiben rates of 6 qt or 3.6 lb of 75DS formulation per acre have been satisfactory in most SDSU tests. Preplant or preemergence applications may be made in liquid fertilizer carrier. Minimum carrier is 10 gpa for ground and 3 to 5 gpa for air.

**SHALLOW PREPLANT INCORPORATED.** Weed control less than for preemergence application except under extremely dry conditions. Incorporate before planting into the top 2 inches of soil with shallow disk or other suitable equipment.

**PREEMERGENCE.** Preferred application method. Must have ½-1 inch of rainfall within one week after application. Use rotary hoe or harrow if rainfall is not received within 3 to 5 days.

**POSTEMERGENCE.** May be applied when soybeans are in cracking to second trifoliate stage. Apply 5 to 6 qt/A Amiben or 3 to 3 1/2 lb/A Amiben 75DS. Dependent upon rainfall. Results improved if emerged weeds are controlled with harrow or rotary hoe. Postemergence Amiben may also be applied with 1 qt/A crop oil concentrate when soybeans are at the cracking to fourth trifoliate leaf stage. Do not apply later than 33 days after planting. Limited tests. Water carrier only.
Lasso and/+ Sencor or Lexone (ALACHLOR AND/-+ METRIBUZIN)

Dual and/+ Sencor or Lexone (METOLACHLOR AND/-+ METRIBUZIN)

2-3 qt Lasso and/+ ½-1 pt Sencor or Lexone 4L or ½-1 lb Sencor or Lexone 50W or ½-7/3 lb Sencor or Lexone 75DF (2-3 and/+ ¼-½ lb act)

1½-2½ pt Dual BE and/+ ½-1 pt Sencor or Lexone 4L or ½-1 lb Sencor or Lexone 50W or ½-7/3 lb Sencor or Lexone 75DF (1½-2½ and/+ ¼-½ lb act)

Very good to excellent control of several annual grasses and small-seeded annual broadleaves. Fair to very good control of some large-seeded annual broadleaves. Metribuzin gives best annual broadleaf control of soil applied treatments. Fair crop tolerance. Risk of injury from metribuzin on variable, sandy, high pH, low organic matter soils or on clay knolls. Do not use on soil that is sandy, has a pH over 7.4, or has less than 1% organic matter. Cold, wet soil conditions that slow emergence increase risk of injury. Combined effects of metribuzin with atrazine carryover can produce serious crop injury. Use lower rates for light, lower organic matter soils. Higher rates are for heavy, clay, low pH soils. Sencor or Lexone at ½ pt of 4L or ½ lb of 50W or ½ lb of 75DF formulation per acre (¼ lb/A active) usually gives satisfactory control of light infestations of many small-seeded broadleaves and reduces risk of injury, especially for inexperienced growers. Use maximum rate for soil type for best control of weeds like sunflower or velvetleaf. May be applied in liquid fertilizer carrier. Minimum carrier is 10 gpa for ground equipment and 5 gpa for Lasso or 2 gpa for Dual with aerial equipment.

SHALLOW PREPLANT INCORPORATED. Tank-mix. Incorporate as for Lasso or Dual alone. Will improve results when rainfall is very limited, but gives slightly less control than preemergence application with adequate rainfall. There is slightly less tolerance to metribuzin applied in this manner. Maximum metribuzin rate for most soils is 3/8 lb/A active. Rates of 2½ qt Lasso or 2 pt Dual + Sencor or Lexone at ¾ pt of 4L or ¾ lb of 50W or ½ lb of 75DF formulation per acre have been satisfactory in most SDSU tests. Use higher rate for heavy, clay soil.

PREEMERGENCE. Tank-mix. Must have ½ to ¾ inch rainfall within one week. Metribuzin applied preemergence gives slightly better control of broadleaves and has slightly better crop tolerance than preplant incorporated. Maximum metribuzin rate is 1¼ lb/A active for most heavy soils. Rates of 2 qt Lasso or 2 pt Dual + Sencor or Lexone at ½ to 1 pt of 4L or ¾ to 1 lb of 50W or ½ to ¾ lb of 75DF formulation per acre have been satisfactory in most SDSU tests. More convenient than split application.

SPLIT PREPLANT INCORPORATED AND PREEMERGENCE. Incorporate the usual rate of Lasso or Dual shallowly before planting. Apply Sencor or Lexone preemergence after planting. Maximum Sencor or Lexone rate is ½ to 3 qt of 4L or ½ to 3 lb of 50W or ½ to 2 lb of 75DF. Slightly better crop tolerance than for preplant tank-mix but requires a second application operation.

SPLIT TANK-MIX PREPLANT INCORPORATED AND PREEMERGENCE. Incorporate a tank-mix of the usual rate of Lasso or Dual with Sencor or Lexone as for the preplant incorporated treatment. Apply additional Sencor or Lexone preemergence after planting. Rates for additional Sencor or Lexone range from ¼ to ½ pt of 4L or ¼ to 1 lb of 50W or ½ to 2 lb of 75DF formulation per acre. Rate of ½ pt of 4L or ½ lb of 50W or ½ lb of 75DF Sencor or Lexone formulation per acre has been used as the overlay in most SDSU tests. Allows for better crop tolerance when higher Sencor or Lexone rates are needed for better control of weeds such as velvetleaf. Promising for special situations where broadleaves are serious. Follow label directions carefully.

Lasso + Lorox (ALACHLOR + LINURON)

Dual + Lorox (METOLACHLOR + LINURON)

1½-3 qt Lasso + 1-3 lb Lorox 50W or 1-3 pt Lorox 4L (1½-3 + ½-1½ lb act)

1¼-2½ pt Dual BE + 1-3 lb Lorox 50W or 1-3 pt Lorox 4L (1¼-2½ + ½-1¾ lb act)

Tank-mix. Very good to excellent control of several annual grasses. Very good control of several small-seeded annual broadleaves. Good crop tolerance. More risk on light soil. Low rates are for light, low organic matter soils. Higher Lorox rates improve control of some large-seeded broadleaves, but increase risk of injury. Slightly less risk of injury than with metribuzin combinations. Rates of 2 qt Lasso or 2 pt Dual + Lorox at 2 lb of 50W or 2 pt of 4L formulation per acre have been satisfactory in most SDSU tests. Do not use on sandy soils. Combined effects of Lorox with atrazine carryover can produce serious crop injury. May be applied in liquid fertilizer. Plant seed at least 1¾ inch deep. Apply by ground or air as for Lasso or Dual alone.

PREEMERGENCE. As for Lasso or Dual alone. Do not incorporate.
Lasso and/ + Amiben (ALACHLOR AND/ + CHLORAMBEN)

Dual and/ + Amiben (METOLACHLOR AND/ + CHLORAMBEN)

2 qt Lasso and/ + 4 qt Amiben or 2.4 lb Amiben 75DS (2 and/ + 1.8 lb act)

1½-2½ pt Dual BE and/ + 4-6 qt Amiben or 2.4-3.6 lb Amiben 75DS (1½-2½ and/ + 1.8-2.7 lb act)

Very good to excellent control of several annual grasses. Very good control of several small-seeded annual broadleaves. Fair control of some large-seeded annual broadleaves. Very good crop tolerance. Weed control and crop tolerance affected less by soil variation than with linuron or metribuzin combinations. Low rates are for light, low organic matter soil. Rates of 2 qt Lasso or 2 pt Dual + Amiben at 4 qt or 2.4 lb of 75DS formulation per acre have been satisfactory in most SDSU tests. High Amiben rate improves control of some large-seeded broadleaves. Apply by ground or air as for Lasso or Dual alone.

SHALLOW PREPLANT INCORPORATED. Tank-mix. Incorporate as for Lasso or Dual alone. Rates of 2½ qt Lasso or 2 pt Dual per acre have been satisfactory in most shallow incorporated tests with this combination.

PREEMERGENCE. Tank-mix. Preferred application method for most situations.

SPLIT PREPLANT INCORPORATED AND PREEMERGENCE. Incorporate Dual or Lasso shallow preplant incorporated and apply Amiben preemergence. Amiben may be banded to reduce cost.

Lasso + Modown (ALACHLOR + BIFENOX)

2-3 qt Lasso + 2½-4 pt Modown 4F (2-3 + 1¼-2 lb act)

Tank-mix. Very good to excellent control of several annual grasses and good control of some small-seeded annual broadleaves. Very good on pigweed. Fair control of some large-seeded annual broadleaves. Fair crop tolerance. Weed control and crop tolerance affected less by variation in soil type than with linuron or metribuzin combinations; however, leaf burn and stunting can be serious if raindrops splash bifenox onto the emerging crop. Yields are usually not affected. Shallow incorporation reduces problem. Low rates are for light, low organic matter soil. Rates of 2 qt Lasso + 3 pt Modown per acre have been satisfactory in most SDSU tests. Minimum carrier is 15 gpa for ground application.

SHALLOW PREPLANT INCORPORATED. Incorporate into top 1 inch of soil with rotary hoe, shallow field cultivator, or other suitable equipment. Do not use a disk. Must be shallow or weed control is reduced. Less crop injury. Furrow planting moves treated soil from row area.

PREEMERGENCE. Must have ¼ to ½ inch of rain within one week after planting. Use a rotary hoe or harrow if rain is not received within 7 days after planting. Method will improve control and reduce risk of crop injury.

Basagran (BENTAZON)

¾-1 qt Basagran (¼-1 lb act)

POSTEMERGENCE. Excellent control of cocklebur and very good control of small sunflower and velvetleaf. Pigweed, nightshade, and kochia usually are not controlled. Soybeans are usually in the unifoliolate to 2-trifoliolate leaf stage but are tolerant at all growth stages. Excellent crop tolerance. Some leaf margin burn may occur if plants are under stress. Best results under good growing conditions; less effective under low humidity or dry conditions.

The low rate is for cocklebur under 6 inches, velvetleaf under 2 inches, or sunflower or mustard under 4 inches. High rate is for larger weeds but before cocklebur is 10 inches, velvetleaf 5 inches, or sunflower or mustard 6 to 7 inches. Late season treatment of two applications of ¾ qt/A applied 10 to 14 days apart or a single application of 1½ qt/A will give partial control of cocklebur up to 24 inches.

Primarily contact action. Good coverage important. Minimum carrier is 20 gpa for ground or 5 gpa for air with minimum of 40 psi boom pressure. Do not use flood-jet nozzles. Very small amounts of 2,4-D or Banvel contamination in tank, hoses, boom, or container can cause severe damage. Do not cultivate for 3 to 5 days after application. See special weed problem section for perennial weed control.

Petroleum-base non-phytotoxic oil concentrate is suggested for some situations. Oil is suggested for velvetleaf, ragweed, and lambquarters. Not required for cocklebur. Maximum oil rate is 1 qt/A for ground and 1 pt/A for air. Crop leaf burn is usually not increased except with very high temperature or high humidity.
### Blazer (ACIFLUOREN)

**1½-2 pt Blazer 2L (3/8-1/2 lb act)**

**POSTEMERGENCE.** Good to excellent control of certain annual broadleaves, including black nightshade, pigweed, and wild mustard. Results on velvetleaf and cocklebur are more variable. Topgrowth burn on field bindweed and Canada thistle has been satisfactory in most situations. Some annual grass suppression noted. Fair crop tolerance. Leaf burn or speckling is frequently noted. Crop recovers rapidly under good growing conditions. Most risk is during times of high humidity and high temperature. Delay cultivation for 7 days before or after application. Rainfall within 6 hours reduces control.

Primarily a contact herbicide. Good coverage is important. Apply when weeds are in the 2- to 4-leaf stage, usually within 21 days after crop emergence. Rate of 2 pt/A has been used in most SDSU tests. Add 1 pt of non-ionic surfactant per 100 gal of solution. To control escaped grasses at the 2- to 4-leaf stage, lambsquarters, buffalo bur and other hard to control weeds, increase the surfactant to 2 to 4 pt per 100 gal of solution. The previous 2S formulation did not require surfactant. Areas may be retreated but the total applied should not exceed 4 pt/A. Good coverage important. Do not use flood nozzles. Minimum carrier is 20 gpa for ground or 10 gpa for air. Use 40 to 60 psi pressure. Do not apply within 50 days of harvest.

### Basagran + Blazer (BENTAZON + ACIFLUOREN)

**1-2 pt Basagran + 1-2 pt Blazer 2L (½-1 + ¼-½ lb act)**

**POSTEMERGENCE.** Tank-mix. Combination intended to provide control of more species than either herbicide used alone. Blazer improves the control of pigweed and lambsquarters. Basagran is best for velvetleaf or cocklebur. Suggested rates vary according to the product label. The rates range from 1 to 2 pt Basagran plus 1 to 2 pt Blazer per acre. The rate may be adjusted to about 75% of the normal rate of the herbicide which will give the best control of the predominant weed and about 50% of the normal rate for the other product. The rate of 1½ pint of each is suggested for heavy stands of mixed weed species. Use at least 1 pt/A Basagran in the mixture to control cocklebur up to the 6-leaf stage and at least 1½ pt/A Basagran if velvetleaf is a significant problem. The label directions for rates and use of surfactant or crop oil vary on product labels. Non-ionic surfactant at 1 pt per 100 gal of solution should be used for general application. Surfactant should be increased to 2 to 4 pints per 100 gal of solution for escaped grasses. Crop oil concentrate at 1 qt/A is suggested for velvetleaf. For most severe weed situations, crop oil may be increased to 1 qt/A; however risk of foliage burn increases. Some temporary leaf burn or speckling usually occurs. Do not apply if crop is under stress. Weeds should be under 2 or 3 inches tall for best results on most weeds. Minimum carrier is 20 gpa for ground and 10 gpa for air.

### Poast (SETHOXIDIM)

**½-2½ pt Poast (.1-.5 lb act)**

**POSTEMERGENCE.** Very good to excellent control of annual grasses. Wild proso millet is controlled with lowest rate. Volunteer corn usually requires the higher rates. Provides some short-term suppression of quackgrass at high rate. Does not control broadleaves. Excellent crop tolerance.

Growth rate of treated grasses is reduced soon after application. Yellowing, reddening, and tip burn all usually noted within 3 weeks after application. Rates are ½ pt/A for wild proso (4-12 in), 1 pt/A for foxtail (3-8 in), and wild cane (6-18 in), 1¼ pt/A for volunteer corn (6-18 in), 2 pt/A for wild oats (2-4 in) and 2½ pt/A for quackgrass (6-8 in). Quackgrass can be retreated with another 1½ pt/A when regrowth reaches 6 to 8 inches.

Crop oil concentrate at 1 qt/A is used with all Poast applications. Avoid cultivation for one week before and one week following application. Rainfall within one hour after application will reduce effectiveness. Control of weeds under drought stress is diminished.

Coverage is important. Use flat fan or hollow cone nozzles. Minimum carrier is 10 gpa for ground and 5 gpa for air. Tank-mixing with other herbicides except as noted on the label can reduce effectiveness. Allow at least one day between sequential applications of other herbicides. Pressure should be 40 to 60 psi. Do not apply within 70 days of harvest. Avoid drift to sensitive crops such as corn, sorghum, or cereals. Poast is formulated as a 1.5 lb/gal liquid.

### Poast and/ + Basagran (SETHOXIDIM AND/ + BENTAZON)

**½-2½ pt Poast and ¾-3¾ qt Basagran (.1-.5 and ¾-1 lb act)**

Poast and Basagran can be applied as sequential treatments or can be tank-mixed using increased rate of Poast. The increased Poast is required to compensate for the antagonistic reaction which results in reduced grass control.
(Poast and/or Basagran, continued)

SEQUENTIAL-POSTEMERGENCE. Apply the labeled rate of each herbicide in a separate application. Either sequence may be followed; however weed development usually suggests Basagran be applied before Poast. Apply as directed for each herbicide alone. Use 1 qt/A crop oil concentrate with each application.

TANK-MIX POSTEMERGENCE. Poast and Basagran may be tank-mixed; however the rate of Poast must be increased 50% compared to the rate when used alone. The Basagran rate is the same as for Basagran alone. Follow application directions as for Basagran. Add crop oil concentrate at 1 qt/A.

**Fusilade (FLUAZIFOP-BUTYL)**

\[ \frac{1}{4}-\frac{1}{2} \text{ pt Fusilade (1/8-1/4 lb act)} \]

POSTEMERGENCE. Good to excellent control of annual grasses. Wild proso millet, wild cane, and volunteer corn are controlled with lowest rates. Foxtail usually requires the higher rate. Provides some short term suppression of quackgrass at high rate. Does not control broadleaved weeds. Excellent crop tolerance.

Growth rate of treated grasses is reduced soon after application. Weeds show leaf yellowing or browning 10 to 14 days after treatment. Control of foxtail has been variable under moisture stress conditions. Volunteer corn control is more consistent.

Rates are \( \frac{1}{4} \text{ pt/A for wild proso (4-8 in), wild cane (6-12 in), volunteer corn (12-18 in). Use } \frac{1}{2} \text{ pt/A for foxtail, wild oats, and other annual grasses 2 to 4 inches tall. For quackgrass, apply } \frac{1}{2} \text{ pt/A when quackgrass has at least four leaves but is not over 10 inches tall. Repeat the treatment when quackgrass regrowth has three to five leaves.} \]

Use 1 qt crop oil concentrate or \( \frac{1}{4} \text{ pt non-ionic surfactant per 25 gal of solution with all Fusilade applications. Avoid cultivation for one week before and one week after application. Rainfall within 1 hour after application will reduce effectiveness.} \]

Coverage is important. Do not use flood nozzles. Minimum carrier is 10 gpa for ground application. Use 30 to 60 psi. Tank-mixing with other herbicides can reduce effectiveness.

Do not apply after soybean bloom or within 100 days of harvest. Do not plant crops other than soybeans for 60 days after application. Avoid drift to sensitive crops such as corn, sorghum, or cereals.

**OTHER SOYBEAN HERBICIDES**

**Vernam + Treflan (VERNOLATE + TRIFLURALIN)**

**Vernam + Basalin (VERNOLATE + FLUCHLORALIN)**

**Vernam + Prowl (VERNOLATE + PENDIMETHALIN)**

**Vernam + Amiben (VERNOLATE + CHLORAMBIEN)**

**Vernam + Lasso (VERNOLATE + ALACHLOR)**

\[ \frac{1}{4}-\frac{3}{2} \text{ pt Vernam 7E + 1-1\frac{1}{2} \text{ pt Treflan}} \]

\[ \frac{1}{4}-2\frac{1}{2} \text{ pt Vernam 7E + } \frac{3}{4}-1 \text{ pt Basalin} \]

\[ \frac{1}{4}-3 \text{ pt Vernam 7E + } \frac{3}{4}-1\frac{1}{2} \text{ pt Prowl} \]

\[ 2\frac{1}{2} \text{ pt Vernam 7E + } 5 \text{ qt Amiben or } 3 \text{ lb Amiben 75DS} \]

\[ \frac{1}{4}-3 \text{ pt Vernam 7E + } 1-2 \text{ qt Lasso} \]

PREPLANT INCORPORATED. Tank-mix. Incorporate as for Vernam alone. Both herbicides in the combinations are primarily for annual grass control except for Vernam + Amiben. Deep incorporation of Amiben reduces control of small-seeded annual broadleaves except under very dry conditions. Fair to good velvetleaf control with Vernam + Amiben. Treatments appear to have limited potential compared to other alternatives available. Refer to sections for each herbicide alone.
Vernam and Amiben (VERNOLATE AND CHLORAMBEN)

Vernam and Lorox (VERNOLATE AND LINURON)

1¾-3 pt Vernam 7E and 4-6 qt Amiben or 2.4-3.6 lb Amiben 75DS

1¾-3 pt Vernam 7E and 1-2½ lb Lorox 50W

SPLIT PREPLANT INCORPORATED AND PREEMERGENCE. Incorporate the recommended rate of Vernam as for Vernam alone. Apply Amiben or Lorox preemergence. Good to very good control of several small-seeded annual broadleaves. Less consistent grass control. Vernam gives somewhat better velvetleaf control than other preplant treatments. Amiben or Lorox further improves broadleaf control. Appears to be limited to situations where velvetleaf is part of a serious broadleaf problem and soil factors exclude the use of metribuzin. Refer to section for each herbicide.

Vernam + Treflan + Sencor or Lexone (VERNOLATE + TRIFLURAUN + METRIBUZIN)

2½-3½ pt Vernam 7E + 1 pt Treflan + ½-¾ lb Sencor or Lexone 50W or ½-¾ pt Sencor or Lexone 4L

PREPLANT INCORPORATED. Three-way tank-mix. Incorporate as for Vernam alone. Expected to provide excellent annual grass control and good to excellent control of annual broadleaves. Vernam + Sencor or Lexone has provided very good velvetleaf control and will usually be superior to other two-way combinations with Sencor or Lexone on this weed. Some early searing can be expected. Follow soil precautions for Sencor or Lexone.

Treflan and/+ Furloe (TRIFLURAUN AND/+ CIPC)

Vernam and/+ Furloe (VERNOLATE AND/+ CIPC)

1-2 pt Treflan and/+ 2-3 qt Furloe 4EC

2½-3 pt Vernam 7E and/+ 2-3 qt Furloe 4EC

Furloe gives very good to excellent control of smartweed and wild buckwheat. Control of large-seeded annual broadleaves is not improved. Good to excellent control of annual grasses. Very good crop tolerance. Low rates are for light, low organic matter soil. Minimum carrier is 10 gpa. Appears to have limited potential, except where smartweed is a major problem. Refer to section for each herbicide used alone.

PREPLANT INCORPORATED. Tank-mix. Incorporate into the top 1½ to 2 inches of soil as for Treflan or Vernam alone. Split application preferred, as deep incorporation reduces Furloe performance.

SPLIT PREPLANT INCORPORATED AND PREEMERGENCE. Incorporate Treflan or Vernam as recommended for each herbicide used alone. Apply Furloe preemergence. Preferred application method.

Treflan + Amiben + Sencor or Lexone (TRIFLURAUN + CHLORAMBEN + METRIBUZIN)

Prowl + Amiben + Sencor or Lexone (PENDIMETHALIN + CHLORAMBEN + METRIBUZIN)

1-2 pt Prowl + 3-5 qt Amiben or 1.8-3 lb Amiben 75DS + ½-¾ lb Sencor or Lexone 50W or ½-¾ pt Sencor or Lexone 4L or ½-¾ lb Sencor or Lexone 75DF

1½-2½ pt Prowl + 3-4 qt Amiben or 1.8-2.4 lb Amiben 75DS + ½-¾ lb Sencor or Lexone 50W or ½-¾ pt Sencor or Lexone 4L or ½-¾ lb Sencor or Lexone 75DF

Three-way combinations. These combinations are intended to improve weed control with Treflan or Prowl + Amiben combinations while minimizing the risk of injury associated with Sencor or Lexone. Provides very good to excellent control of many annual weeds; however control of weeds such as velvetleaf or cocklebur is less than for the combinations using full Sencor or Lexone rates. Appears to have limited potential for most weed situations. Follow soil limitations as for Sencor or Lexone.

PREPLANT INCORPORATED. Tank-mix. Incorporate as for Treflan or Prowl alone.

PREEMERGENCE. Tank-mix. Prowl + Amiben + Sencor or Lexone only. Control is dependent on rainfall before weed emergence. Incorporated applications of Prowl preferred.
Dual + Treflan (METOLACHLOR + TRIFLURALIN)

2-3 pt Dual BE + 1-2 pt Treflan

PREPLANT INCORPORATED. Tank-mix. Incorporate as for Dual or Treflan alone. It's difficult to incorporate both herbicides properly with the same incorporation method. Both herbicides are most effective on annual grasses. Appears to have limited potential for weed problems in most field situations.

Lasso + Amiben + Sencor or Lexone (ALACHLOR + CHLORAMBEN + METRIBUZIN)

Lasso + Amiben + Sencor or Lexone (METOLACHLOR + CHLORAMBEN + METRIBUZIN)

2-3 qt Lasso + 3-6 qt Amiben or 1.8-3.6 lb Amiben 75DS + ½-1 lb Sencor or Lexone 50W or ½-1 pt Sencor or Lexone 4L or ½-1½ lb Sencor or Lexone 75DF

1½-3 pt Dual BE + 3-6 qt Amiben or 1.8-3.6 lb Amiben 75DS + ½-1 lb Sencor or Lexone 50W or ½-1 pt Sencor or Lexone 4L or ½-1½ lb Sencor or Lexone 75DF

Three-way tank-mix. Intended to improve control of certain weeds which are not controlled by Lasso or Dual + Amiben combination while reducing the risk of injury associated with Sencor or Lexone. Provides very good to excellent control of many annual weeds; however control of weeds such as velvetleaf or cocklebur is less than for the combinations using full Sencor or Lexone rate. Appears to have limited potential for most weed situations. Follow soil limitations as for Sencor or Lexone.

SHALLOW PREPLANT INCORPORATED. Incorporate as for Lasso or Dual alone.

PREEMERGENCE. As for Lasso or Dual alone. Do not apply after crop emerges. Rainfall required.

Lasso + Lorox + Lexone (ALACHLOR + LINURON + METRIBUZIN)

Lasso + Lorox + Lexone (METOLACHLOR + LINURON + METRIBUZIN)

1½-3 qt Lasso + ¾-2 lb Lorox 50W or ¾-2 pt Lorox 4L + ½-1 lb Lexone 50W or ½-1 pt Lexone 4L or ½-1½ lb Lexone DF

1½-2½ pt Dual BE + ¾-2 lb Lorox 50W or ¾-2 pt Lorox 4L + ½-1 lb Lexone 50W or ½-1 pt Lexone 4L or ½-1½ lb Lexone DF

Three-way tank-mix. Intended to improve control of broadleaves which are not adequately controlled by the two-way combinations. Excellent general broadleaf control. Performance on velvetleaf primarily dependent on rate of Lexone. If the rates are reduced to lessen risk of injury, velvetleaf control will diminish. Not suggested for soils other than those where it is safe to use full Lexone rate. There is considerable risk of injury from the combined effect of Lorox and Lexone if full rates of each are used. Do not use on light, sandy soil or soil with a pH over 7.5.

PREEMERGENCE. Apply as soon as possible after planting. Do not incorporate or apply after crop emergence.

Modown (BIFENOX)

3-4 pt Modown 4F

PREEMERGENCE. Most useful in shallow preplant or preemergence combinations to improve control of certain broadleaves. Not suggested for use alone.

Lorox (LINURON)

1-5 lb Lorox 50W or 1-5 pt Lorox 4L

PREEMERGENCE. Most useful in preemergence combinations to improve broadleaf control. Not suggested for use alone.
**Sencor or Lexone (METRIBUZIN)**

<table>
<thead>
<tr>
<th>½-1 lb Sencor or Lexone 50W or ½-1 pt Sencor or Lexone 4L or ½-7½ lb Sencor or Lexone 75DF</th>
</tr>
</thead>
</table>

Most useful in preplant or preemergence combinations to improve broadleaf control. Not suggested for use alone.

**Surflan (ORYZALIN)**

<table>
<thead>
<tr>
<th>1-2 lb Surflan 75W or ¾-1½ qt Surflan AS</th>
</tr>
</thead>
</table>

PREEMERGENCE. Chemically related to Treflan but does not require incorporation. Weed control has been less satisfactory than for Treflan. May be applied in fall or in spring directly to undisturbed stubble for no-till soybeans. Potential for use alone or in combination with other herbicides in reduced tillage systems will continue to be evaluated. May be tank-mixed at ½ to 1¼ qt/A with Lorox, Sencor, Lexone, Dynap, Goal, or Amiben. May be applied in liquid fertilizer carrier.

**Amiben + Lorox (CHLORAMBEN + LINURON)**

**Amiben + Sencor or Lexone (CHLORAMBEN + METRIBUZIN)**

<table>
<thead>
<tr>
<th>3-4½ qt Amiben or 1.8-2.7 lb Amiben 75DS + ½-3 lb Lorox 50W or 1-3 pt Lorox 4L</th>
</tr>
</thead>
</table>

PREEMERGENCE. Tank-mix. Limited data. More effective on annual broadleaves than annual grasses. Adjust rates for soil type. Will allow for reduced rates of metribuzin for small-seeded weeds like Russian thistle; however velvetleaf and sunflower control will not be maintained. May be applied in liquid fertilizer. Refer to section for Amiben, or sections for Lorox, Sencor, or Lexone combinations.

**Furloe + Lasso (CIPC + ALACHLOR)**

<table>
<thead>
<tr>
<th>2-3 qt Furloe 4EC + 2-3 qt Lasso</th>
</tr>
</thead>
</table>

PREEMERGENCE. Furloe gives very good to excellent control of smartweed and wild buckwheat. Lasso gives good to excellent control of annual grasses. Less effective on other small-seeded annual broadleaves. Does not control large-seeded annual broadleaves. Preemergence combinations better than preplant incorporated Furloe combinations. Use high rates for most soils. Very good crop tolerance. Minimum carrier is 5 gpa water. Refer to Lasso section.

**Goal (OXYFLUORFEN)**

<table>
<thead>
<tr>
<th>1½-2 pt Goal 2E</th>
</tr>
</thead>
</table>

PREEMERGENCE. Goal is chemically related to Modown. Weed control and crop effects similar. Most effective on annual broadleaved weeds such as pigweed. Fair control of certain large-seeded broadleaves. Grass control is usually unsatisfactory. Crop tolerance is marginal. Leaf burn and temporary stunting frequently noted. Most emphasis in future will be for use in no-till soybeans. Crop tolerance is not associated with soil texture or pH factors.

**Goal + Lasso (OXYFLUORFEN + ALACHLOR)**

<table>
<thead>
<tr>
<th>1½-2 pt Goal 2E + 1½-2½ qt Lasso</th>
</tr>
</thead>
</table>

**Goal + Dual (OXYFLUORFEN + METOLACHLOR)**

<table>
<thead>
<tr>
<th>1½-2 pt Goal 2E + 1½-2½ pt Dual 8E</th>
</tr>
</thead>
</table>

PREEMERGENCE. Tank-mix. Refer to Goal alone. Provides good to excellent control of annual grasses and certain annual broadleaves. Velvetleaf or cocklebur control less consistent. Primary emphasis is for use in no-till systems.

525B/12
Premerge (DINOSEB)

1 pt-2½ gal Premerge

Contact herbicide. Follow handling precautions as it is highly toxic. Minimum carrier is 3 gpa for air and 30 gpa for ground.

PREEMERGENCE. Rates are 2 to 2½ gal/A Premerge. Erratic annual weed control. Short residual. Not for light soil.

EARLY POSTEMERGENCE. Rates are 2 to 3 qt/A Premerge. Apply when soybeans are in cotyledon stage but before first true leaves open. Timing is critical. Usually better control than preemergence. Emerged weeds only. Use low rate when temperature is over 75°F. Considerable risk of leaf burn.

LATE POSTEMERGENCE. Salvage treatment for cocklebur. Apply. Rates are 1 to 2 pt/A Premerge. Low rate for small weeds. Save treatment for cocklebur. Apply from first true leaves until bloom stage. Temporary leaf burn. Crop under stress may be permanently damaged. Use at grower’s risk. Minimum carrier is 3 gpa.

Premerge + Lasso (DINOSEB + ALACHLOR)

Premerge + Dual (DINOSEB + METOLACHLOR)

Premerge + Amiben (DINOSEB + CHLORAMBEN)

PREEMERGENCE. Tank-mix. Rates are 4 to 6 qt Premerge + 2 to 3 qt Lasso or 1½ to 2½ pt Dual 8E or 3 to 4 qt Amiben per acre. Refer to Premerge section.

EARLY POSTEMERGENCE. Tank-mix. Rates are 2 to 3 qt Premerge + 1½ to 3 qt Lasso or 1½ to 2½ pt Dual 8E or 3 to 4 qt Amiben per acre. Refer to Premerge section.

Dynap (NAPTALAM + DINOSEB)

2-6 qt Dynap

Commercial premix. Contains 2 lb naptalam and 1 lb dinoseb per gallon. Poor to fair annual weed control. Usually used in combination with other herbicides.

PREEMERGENCE. Apply 6 qt/A Dynap up to cracking stage. Some risk of crop injury with heavy rainfall.

POSTEMERGENCE. Apply 2 to 4 qt/A Dynap in 8 to 10 gal of water after soybeans have second trifoliate leaf but before they are 20 inches tall. Use 20 gpa carrier if temperatures are under 80°F. Primarily for cocklebur. Fair sunflower and mustard control. High rate is for weeds up to 6 inches tall. Considerable risk of crop leaf burn and stunting. Risk is greater at temperature over 90°F. Do not apply when plants are wet. Use minimum of 40 psi pressure.

Dynap + Lasso (NAPTALAM + DINOSEB + ALACHLOR)

Dynap + Dual (NAPTALAM + DINOSEB + METOLACHLOR)

Dynap + Surflan (NAPTALAM + DINOSEB + ORYZALIN)

4 ½-6 qt Dynap + 2 qt Lasso

4 ½-6 qt Dynap + 1½-2½ pt Dual 8E

4 ½-6 qt Dynap + ½-1½ lb Surflan 75W or ½-1¼ qt Surflan AS

PREEMERGENCE. Tank-mix. Dynap contains 2 lb naptalam + 1 lb dinoseb per gallon. Apply before soybeans reach cracking stage. Somewhat erratic. Slight improvement in short-term broadleaved control. Will improve control of cocklebur emerging at time of application. Refer to section for each herbicide.
Blazer + Butyric 200 or Butoxone (ACIFLUORFEN + 2,4-DB)

1½-2 pt Blazer 2L + 2 oz Butyric 200 or Butoxone

POSTEMERGENCE. Tank-mix. Primarily for use in special situations where weeds exceed the maximum height for Blazer. The addition of 2,4-DB provides some improved control of cocklebur, ragweed, and pigweed up to 12 inches tall. Considerable soybean leaf and stem twisting and some yellowing can be expected. Some differential varietal tolerance to 2,4-DB has been reported. Do not add oil or surfactant. Do not treat plants under stress. Use maximum recommended rate of Blazer and 2 fl oz of Butyric 200 or Butoxone per acre. Appears to have very limited potential for most field situations. Refer to Blazer section.

Basagran + Butyric 200 (BENTAZON + 2,4-DB)

1½-2 pt Basagran + 1/8 pt Butyric 200

POSTEMERGENCE. Tank-mix. Primarily for improved control of annual morning glory, which escapes Basagran coverage and early application required, for Basagran increases risk of injury from 2,4-DB portion. Corsoy, Amcor, and SRF 250 are reported to be more sensitive to 2,4-DB. Do not treat plants under stress. Do not add oil or surfactant. Appears to have very limited potential for most field situations. Refer to Basagran alone.

Alanap L + Butyric 200 or Butoxone (NAPTALAM + 2,4-DB)

Rescue

2-3 qt Alanap L + 3-4 fl oz Butyric 200 or Butoxone

2-3 qt Rescue

POSTEMERGENCE. Tank-mix. Or use commercial premix (Rescue) containing 2 lb Alanap L and .06 lb of 2,4-DB active per gallon. Primarily intended as a "rescue" treatment to control broadleaved annual weeds that cannot be controlled with other postemergence treatments. Good sunflower, mustard, and cocklebur control has been noted. Late season weed growth and some seed production is reduced. Maximum effects on weeds usually apparent in 3 weeks. Rate of 2 to 3 qt/A of Rescue is equivalent to the tank-mix of 2 to 3 qt Alanap L + 3 to 4 fl oz of Butoxone or Butyric 200 per acre. Use high rate for weeds over 10 to 12 inches tall. Add non-ionic surfactant or crop oil concentrate at 2 qt/100 gal solution. Apply after first bloom to midbloom. Leaf abnormalities or stunting may be increased with earlier application. Corsoy, Amcor, and SRF 250 are reported to be more sensitive to 2,4-DB. Do not apply within 60 days of harvest.

NO-TILL HERBICIDES

Paraquat-Plus or Gramoxone (PARAQUAT)

½-2 pt Paraquat-Plus or Gramoxone

HARVEST AID. Apply ½ to 1 pt/A paraquat when at least 65% of the seed pods have reached a mature color or when seed moisture is under 30%. The purpose is to dry weeds to facilitate harvest. Paraquat is the only desiccant labeled for use on soybeans that are to be used other than for seed for planting. Less effective on large kochia or Russian thistle than on other actively growing weeds. Contact treatment. Minimum carrier is 20 gpa for ground or 5 gpa for air. Add 1 qt X-77 spreader per 100 gal of solution. Do not graze treated soybean fields for 15 days after spraying, and remove livestock at least 30 days before slaughter. Follow handling precautions, as paraquat is highly toxic. Restricted Use pesticide.

NO-TILL or REDUCED TILLAGE SYSTEMS. Paraquat is a non-selective, non-residual, contact herbicide which can be used to control emerged weeds at planting. It is used in combination with preemergence herbicides for residual control. Rates of 1 to 1½ pt/A paraquat are adequate for small weeds; the high rate is for larger weeds or dense stands. Add 1 to 2 pt X-77 spreader per 100 gal of solution. Minimum carrier is 20 to 40 gpa. Thorough coverage is very important. Refer to harvest aid section for precautions. Several combinations labeled for use with paraquat are listed below.
(Paraquat-Plus or Gramoxone, continued)

Amount of product per acre, tank-mix (Liquid formulations are listed; however, an equivalent amount of other formulations may be used. Add X-77 at the rate of 1 to 2 pt/100 gal of solution):

1-2 pt paraquat + 2-2½ qt Lasso + ½-1 pt Sencor or Lexone
1-2 pt paraquat + 1½-2½ pt Dual + ½-1 pt Sencor or Lexone
1-2 pt paraquat + 1-2½ pt Prowl + 1-2½ pt Lorox
1-2 pt paraquat + 1-2½ pt Prowl + ¾-1 pt Sencor or Lexone
1-2 pt paraquat + 1½-2½ pt Dual + 1-3 pt Lorox
1-2 pt paraquat + 2-3 qt Lasso + 1-3 pt Lorox
1-2 pt paraquat + 2-2½ qt Lasso + 4 qt Amiben
1-2 pt paraquat + 1½-2½ pt Dual + 4-6 qt Amiben
2 pt paraquat + ½-1¼ qt Surflan + ½-1 pt Sencor or Lexone
2 pt paraquat + ½-1¼ qt Surflan + 1-2 pt Lorox

Roundup (GLYPHOSATE)

Roundup is a non-selective, translocated, foliage applied herbicide used in no-till or reduced tillage systems, as a spot treatment for perennials, or in specialized application equipment. There is no soil residual. All emerged vegetation coming in contact with the herbicide will be damaged or killed.

NO-TILL or REDUCED TILLGE SYSTEMS. Roundup may replace one tillage to control emerged weeds. It is used in combination with preemergence herbicides to provide residual weed control. Use lower rate for annual weeds under 6 inches tall and high rate for taller annuals. Minimum carrier is 5 gpa water. Several combination treatments are listed below.

Amount of product per acre, tank-mix (Liquid formulations are listed; however, an equivalent amount of other formulations may be used):

1-1½ qt Roundup + 2-3 qt Lasso + 1-3 pt Lorox
1-1½ qt Roundup + 1½-2½ pt Dual + 1-3 pt Lorox
1-1½ qt Roundup + 2-3 qt Lasso + ½-1 pt Sencor or Lexone
1-1½ qt Roundup + 1½-2½ pt Dual + ½-1 pt Sencor or Lexone
1-1½ qt Roundup + ½-1¼ qt Surflan + ½-1 pt Sencor or Lexone
1-1½ qt Roundup + ½-1¼ qt Surflan + 1-2 pt Lorox
1-1½ qt Roundup + 2-2½ qt Lasso + 4 qt Amiben
1-1½ qt Roundup + 2-2½ pt Dual + 4-6 qt Amiben

SPOT TREATMENT. Roundup may be used at 2 to 4 qt/A to control small patches of perennial weeds such as quackgrass or Canada thistle. It is usually applied with hand-held equipment. Use extreme caution to prevent drift. Crop contacted by spray or drift will be damaged or killed. Refer to label for mixing directions and precautions.

SPECIAL APPLICATION EQUIPMENT. Roundup used in special equipment gives very good control of volunteer corn or wild cane. Results with wild sunflower have been fair. Control of milkweed and hemp dogbane has been more erratic. A height differential is required so the taller weeds are treated over the top of the soybeans. Uniform weed emergence and sufficient height differential improve results. Equipment is usually operated at 3 to 5 mph. Do not add 2,4-D or other herbicides. Consult label directions for the equipment being used.

"Recirculating Sprayers (RCS)" direct the spray across the top of the soybeans. Box type operate between the rows and broadcast types operate independent of row spacing. Spray not intercepted by the weeds is collected in a recovery chamber and goes back through the system. The RCS has been more effective than the rope wick for hemp dogbane and milkweed. The concentration of Roundup varies from 2 to 6 qt per gallon of water. One gallon of Roundup will usually treat 16 to 20 acres. Equipment must be operated in a manner that minimizes droplet drift and "splash" effects.

"Roller" applicators wipe the herbicide onto the taller weeds. The carpet covered roller is continually wetted with solution and rotates as it moves through the field. Some are equipped with electronic sensors that maintain proper roller wetness. Roller applicators avoid drift and splash problems. The Roundup to water ratio is 1 to 19 for corn and wild cane and 1 to 9 for broadleaved weeds. One gallon of Roundup usually treats 25 to 60 acres.

"Rope Wick" applicators utilize segments of soft, braided nylon rope which serve as wicks. The rope ends are affixed through a hole into a 3- or 4-inch plastic pipe. The ropes remain wet by diffusion as they wipe the taller weeds. Variations of the wick applicator feature longer, diagonal ropes which are wetted from a supply tank. Wick applicators are inexpensive, efficient, and simple to operate. Drift and splash problems are essentially eliminated. Equipment must be operated to avoid "drips" from the ropes. The solution in the pipe or tank is mixed at a ratio of 1 gallon Roundup to 2 gallons of water. One gallon of Roundup will usually treat 50 to 100 acres.
**Bronco (Alachlor + Glyphosate)**

3¼ - 5 qt Bronco

Commercial premix containing 2.6 lb alachlor (Lasso) + 1.4 lb glyphosate (Roundup) active per gallon. Intended to control emerged weeds in no-till situations. Excellent control of emerged annual grasses. Perennials may be suppressed. Lasso provides residual annual grass control but is dependent upon rainfall before weeds emerge. Bronco can be tank-mixed with Lorox, Lexone, or Sencor for improved annual broadleaf control. Do not apply after crop emergence.

---

**SPECIAL WEED PROBLEMS IN SOYBEANS**

### Annual Grasses (Foxtail, Barnyardgrass, Sandbur)

<table>
<thead>
<tr>
<th>Product</th>
<th>Description</th>
<th>Application Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Treflan or Prowl or Basalin</td>
<td>Preplant incorporated. Equal performance at adjusted rates. Excellent control of several foxtail species. Consistent performance. Good late season control. Fair to good on sandbur at higher rates. Refer to section for each herbicide.</td>
<td></td>
</tr>
<tr>
<td>Lasso or Dual</td>
<td>Preemergence or shallow preplant incorporated. Very good to excellent control of several foxtail species. Preemergence application with adequate rainfall provides best control available. Late season yellow or bristly foxtail may escape. Inconsistent on sandbur. May be tank-mixed with other herbicides without significantly reducing grass control. Refer to section for Lasso or Dual.</td>
<td></td>
</tr>
</tbody>
</table>

### Small Seeded Annual Broadleaves (Pigweed, Lambsquarters, Kochia, Smartweed)

<table>
<thead>
<tr>
<th>Product</th>
<th>Description</th>
<th>Application Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sencor or Lexone</td>
<td>Preemergence or preplant incorporated. Excellent control. Very good on mustard. Use with other herbicides. Rates as low as ¼ lb/A active metribuzin used with other herbicides frequently give adequate control of light infestations. Use higher rates for best control. Less crop tolerance than other treatments on variable, high pH, or light soils. Refer to sections for Sencor or Lexone combinations.</td>
<td></td>
</tr>
<tr>
<td>Lorox</td>
<td>Preemergence. Use with other herbicides. Very good control. Slightly less risk of crop injury than for metribuzin on variable, high pH, or light soils. Refer to sections for Lorox combinations.</td>
<td></td>
</tr>
<tr>
<td>Modown</td>
<td>Preemergence or very shallow preplant incorporated. Use with other herbicides. Excellent on pigweed. Good control of some other broadleaves. Crop tolerance affected less by soil factors; however, leaf burn and stunting can be serious. Harrowing preemergence treatments reduces leaf burn and stunting. Refer to sections for Modown combinations.</td>
<td></td>
</tr>
<tr>
<td>Amiben</td>
<td>Preemergence preferred. Good to very good control. Fair on mustard. Good crop tolerance on variable soils. Use maximum rate for combination treatments for best control. Refer to Amiben section.</td>
<td></td>
</tr>
</tbody>
</table>

### Velvetleaf, Venice Mallow

<table>
<thead>
<tr>
<th>Product</th>
<th>Description</th>
<th>Application Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basagran</td>
<td>Postemergence. Very good control. Use 1 ½ pt/A for weeds up to 2 inches and 1 qt/A for weeds up to 4 inches tall. Larger weeds only partially controlled. Crop oil helpful. Weeds emerging later will escape. Best choice for light, variable, or high pH soils. Refer to Basagran section.</td>
<td></td>
</tr>
<tr>
<td>Sencor or Lexone</td>
<td>Split preplant incorporated tank-mix with Treflan, Prowl, Lasso, or Dual and additional Sencor or Lexone preemergence application. Allows for better crop tolerance with high Sencor rates. Best soil-applied treatment for velvetleaf. Refer to Sencor or Lexone split tank-mix preplant incorporated and preemergence sections.</td>
<td></td>
</tr>
</tbody>
</table>

Preemergence tank-mix or overlay with other herbicides preferred. Very good control. Use as tank-mix with other herbicides or as an overlay for preplant incorporated treatments. Follow precautions for soil factors. Use ½ lb/A active metribuzin if soil type allows. Rate of 3/8 lb/A active metribuzin applied in combination with preplant incorporated herbicides gives slightly less control except under extremely dry conditions. Refer to sections for Sencor or Lexone combinations.

<td>Wild Sunflower</td>
<td>AMIBEN</td>
<td>Preemergence</td>
<td>Good to very good</td>
<td>Use full rate. Refer to Amiben section.</td>
</tr>
<tr>
<td></td>
<td>BASAGRAN</td>
<td>Postemergence, Good control</td>
<td>1 ½ pt/A for weeds up to 4 inches and 1 qt/A for weeds up to 6 inches tall</td>
<td>Crop oil helpful. Weeds emerging later will escape. Best choice for variable or high pH soils. Refer to Basagran section.</td>
</tr>
<tr>
<td></td>
<td>SENCOR or LEXONE</td>
<td>Preemergence, Used as a tank-mix or overlay treatment, Fair control, Use maximum rate for soil type, Most effective soil-applied treatment. Note soil factor precautions in sections for Sencor or Lexone combinations.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Cocklebur</td>
<td>BASAGRAN</td>
<td>Postemergence, Excellent control</td>
<td>1 ½ pt/A for weeds up to 6 inches and 1 qt/A for weeds up to 8 inches tall</td>
<td>Rescue treatment for larger cocklebur. Refer to Basagran section.</td>
</tr>
<tr>
<td>Black Nightshade</td>
<td>LASSO or DUAL</td>
<td>Shallow preplant incorporated or preemergence, Good control, Use maximum rate for soil type, May be used with other herbicides without reduced control if the Lasso or Dual rate is not reduced. Refer to section for Lasso or Dual. Layby cultivation very helpful.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>BLAZER</td>
<td>Postemergence, Good to very good control, Apply when weeds are under 4 inches tall, Risk of leaf burn. Refer to Blazer section.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Wild Cane</td>
<td>TREFLAN</td>
<td>Preplant incorporated, Good control, Use 2-2 ½ pt/A on most medium and heavy soils, Incorporate thoroughly, Cultivate crop, Refer to Treflan section.</td>

</table>
Buffalo Bur

**BLAZER**
Postemergence. Partial control. Apply when weeds are under 4 inches tall. Risk of leaf burn. Refer to Blazer section.

Yellow Nutsedge

**LASSO or DUAL**
Preplant incorporated preferred. Thorough tillage prior to planting helpful. Good to very good control. Dual gives slightly better control. Use maximum rate possible. Refer to shallow preplant incorporated section for Dual or Lasso.

**VERNAM**
Preplant incorporated. Incorporate immediately. Fair to good control. Must use maximum rate for soil type. Refer to Vernam section.

**BASAGRAN**
Postemergence. Apply ¾ to 1 qt/A when weeds are 6 to 8 inches tall. Retreat in 7 to 10 days if necessary. Good control. Crop oil helpful. Useful for spot treatment or as a followup after other treatments. Refer to Basagran section.

Canada Thistle

**BASAGRAN**
Postemergence. Fair to good burn to topgrowth. Apply 1 qt/A when weeds are 8 inches tall to bud stage. Retreat 7 to 10 days later if necessary. Crop oil helpful. Refer to Basagran section.

**BLAZER**
Postemergence. Fair burn of topgrowth. Refer to Blazer section.

### Herbicide Cost

The table below gives the cost per acre for several herbicide treatments using suggested retail prices. The cost listed is for the low and high rate. Prices vary according to location or quantity and frequently are somewhat less than shown. Consult your local dealer for actual prices.
